Glassell St Warehouse) - Demand for Full EIR and Proper Mitigation**Dear Senior Planner Beck,**

I am writing again to submit formal written comments regarding the Draft Mitigated Negative Declaration (MND) for the Rexford Industrial project located at [2411 N. Glassell Street](#) (Project Case SP-1180 / IS/MND No. ENV25-0002).

1. Failure of Meteorological Modeling and Pollution Drift I wish to challenge the validity of the Health Risk Assessment (HRA). The current analysis relies on wind data from the Fullerton Airport, located several miles away. This is physically inadequate for a site located in the North Glassell corridor, which has unique localized wind patterns. Local observations indicate that the residential neighborhood and Fletcher Elementary are situated directly downwind and in the primary drift path of all diesel particulate matter and pollutants from this facility. By using data from a different microclimate, the MND fails to accurately project the concentration of toxic air contaminants that will settle on our homes and schools. I demand that the City require on-site meteorological monitoring or utilize high-resolution local wind projections to re-model the pollution dispersion.

2. Demand for Actual Traffic Data vs. Theoretical Estimates The City must establish a "baseline of actual physical conditions" for current site traffic. The MND relies on ITE Land Use Code 710, which assumes 10.84 daily trips per 1,000 square feet for the existing office buildings. Given the current state of hybrid work and high office vacancy, the actual daily volume is a small fraction of that estimate. This reliance on theoretical data creates a false "net decrease" in traffic. I request that the City conduct empirical driveway counts to establish a factual baseline before claiming the project has no significant impact.

3. Hidden Operational Intensity (Option 2) The environmental analysis is based on a 5-dock "Analyzed Project," yet the plans include "Option 2" with **36 raised dock doors**. This 620% increase in loading capacity will result in a massive increase in heavy truck trips, idling, and pollution that has not been disclosed or mitigated in the current MND.

4. Adherence to § 17.20.220 Residential Mitigation Code I formally request that the City strictly enforce Orange Municipal Code § 17.20.220. To protect the health and safety of the community, the City must mandate a **300-foot buffer**

between the industrial structure and the nearest residential property lines. The current proposal, placing intensive operations as close as 54 feet to sensitive receptors, is a clear violation of the intent of the Residential Mitigation code.

The use of remote wind data, the refusal to use actual traffic counts, and the failure to analyze the 36-dock capacity constitute substantial evidence of a "Fair Argument" that this project will have significant environmental impacts. Therefore, the City must withdraw the MND and require the preparation of a Full Environmental Impact Report (EIR).

Best regards,

Kevin Neu
